The screenshot displays a Windows desktop environment with two open PowerShell windows. The top window shows the invocation details of the Amazon CloudWatch Agent service, including its PID (34905), tasks (8), memory usage (43.7M), CPU usage (27.682s), and group (/system.slice/amazon-cloudwatch-agent.service). It also shows the command being executed: /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent -config /opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.toml. Below this, there are several log entries from the agent, indicating it is reading the configuration file, validating the schema, and detecting the run_as_user. The bottom window shows the service status for amazon-cloudwatch-agent.service, which is active (running) since Thu 2026-07-02 10:49:31 UTC. It also shows the same invocation details as the top window. The taskbar at the bottom includes icons for various applications like Edge, File Explorer, and the Start menu, along with system tray information like temperature (31°C) and time (18:06, 02-07-2026).
